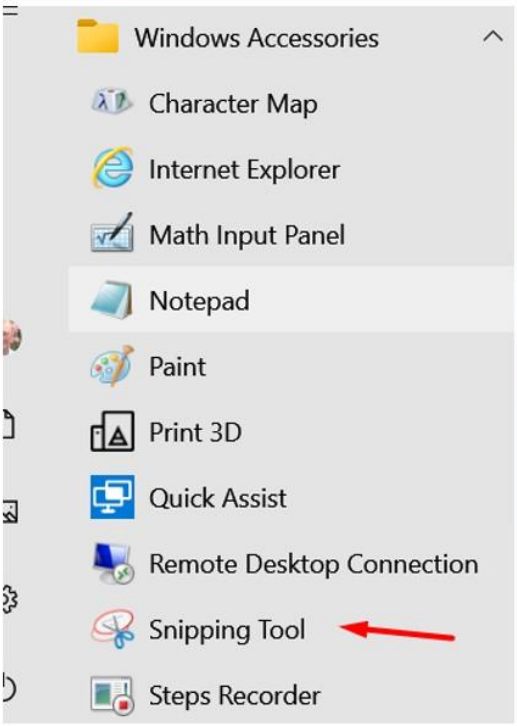
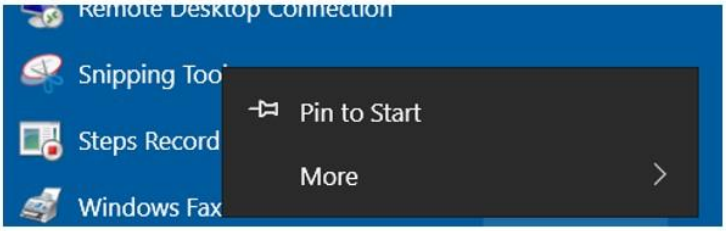
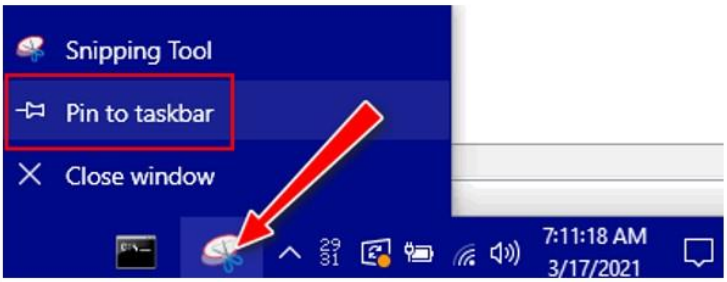
The Snipping Tool Windows 10 and 11

In Windows 11 it also has more features such as video making. A future tutorial.

Microsoft has promoting “Snip and Sketch” but it is not popular. The original Snipping Tool has not gone. It is still alive and well. You can open it by typing Snipping Tool in taskbar search. It is also in the **Start** menu under **Windows Accessories**.
As it still works and is very useful for cutting out images. If you wish to make a Taskbar or Start menu shortcut for it, open the Start menu, click on **Windows Accessories**. Find the Snipping Tool and Right-click on the taskbar icon for the Snipping Tool and choose "**Pin to Taskbar" or “Pin to the Start Menu**.” I have it on my taskbar as well as a more advanced snipping tool called “Lightshot”.

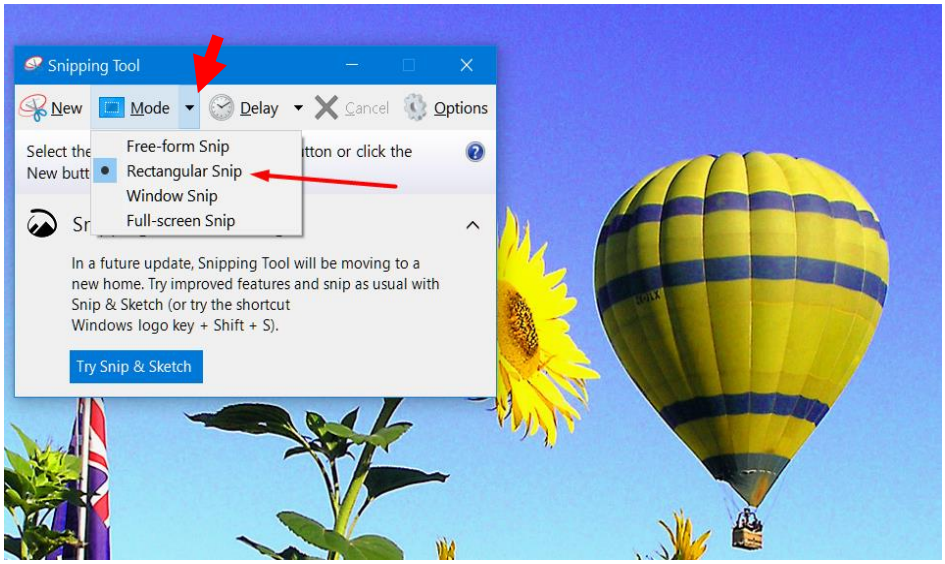




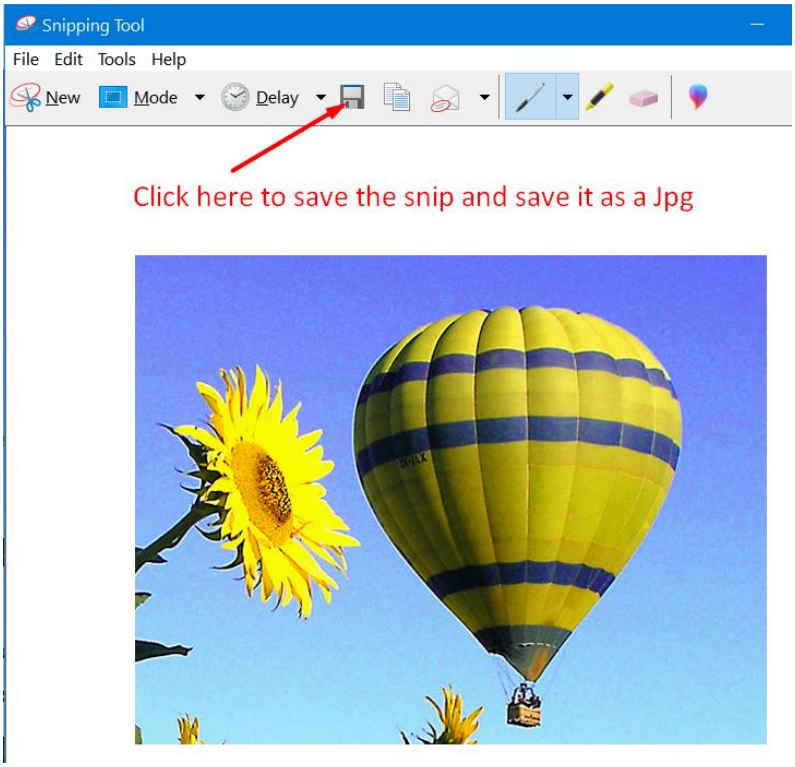


When you use the snipping tool, Microsoft wants you to try “Snip & Sketch”. Ignore this, and click on “Mode” and choose the rectangular snip.

I

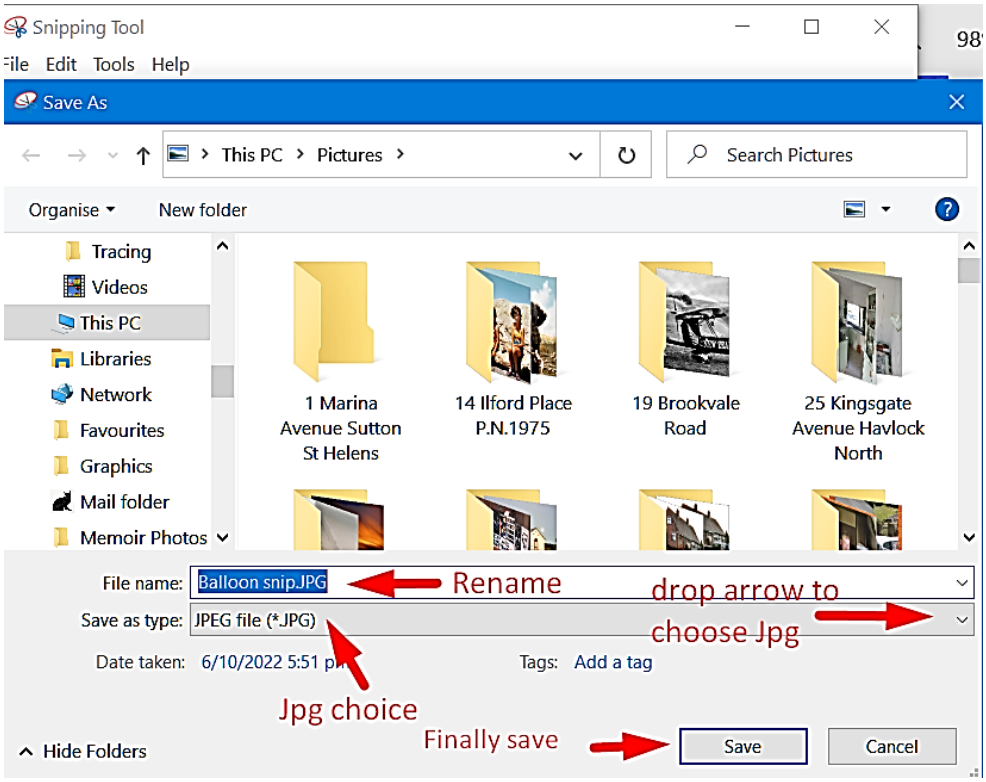


Use your cursor to draw a rectangle around the image or words you want to clip out and you can save it as a Jpeg.



After snipping around the section you want Click on the “save” icon and make the choices as I have done in the image below to save the snip in “Pictures”

The snip will be saved in Pictures as a Jpg.



When I create an image in a Word document or PowerPoint I frequently snip it out to save it as a jpeg such as this name below. There is another tutorial on how to make a name like this.
